What's New in the Super Hybrid Engine?

Super Hybrid Engine is an amazing software available for both notebooks and ultrabooks which enables their owners to achieve a battery life much higher than the standard set by Windows or other utilities. It is the first utility to be able to push the power consumption to the maximum with an energy-saving mode, giving the user the possibility to save battery for up to 7 hours, improving the reliability of the system even more. It can even improve the battery life of Ultrabooks, which is not something that can be done with other utilities. It can be used with Atom, Core i3, Core i5 and Core i7 processors, without requiring any further installation. It works in two modes: Auto and Manual. The Auto mode is self-adjusting and it is the most efficient mode, although this may not be the most reliable, due to the configuration chosen. The Manual mode consists of managing the power consumption of the machine in order to achieve the desired battery life, which depends on the user. The settings are divided into three categories: 1. Auto-related options: - Battery - which allows the user to select the percentage that the power should be granted by the Super Hybrid Engine. - CPU - which allows the user to select the maximum percentage granted to the processor. - Screen - which allows the user to select the brightness to be used by the screens of the notebook. - CPU Load - which allows the user to select the percentage of maximum load to be given to the processor. - Setpoint - which allows the user to select the maximum battery level to be reached, allowing you to use Super Hybrid Engine until this level has been reached. - Stability - which allows the user to select the setting in which the system will operate when instability has been detected. - Performance - which allows the user to select the mode of operation to be used when the performance is lower than expected, to avoid any performance drops. - Startup - which allows the user to select the mode of operation that will be used when the computer is restarted. 2. Power Saving-related options: - Battery - which allows the user to select the percentage of battery that should be reserved for the system. - CPU - which allows the user to select the percentage of maximum power granted to the processor. - Screen - which allows the user to select the brightness to be used by the screens of the notebook. - CPU Load - which allows the user to select the percentage of maximum load to be given to the processor. - Setpoint - which allows the user to select the maximum battery level to be reached, allowing you to use Super Hybrid Engine until this level has been reached. - Stability - which allows the user to select the setting in which the system will operate when instability has been detected. - Performance - which allows the user to select the mode of operation to be used when the performance is lower than expected
